
module class suffix in custom position

Posted by Peter Mathews - 2009/11/11 10:06

I am using custom position and {loadposition mypositionname} to place 2 instances of MiniFP onto a page. All works ok, apart from I cannot customise the look of the two instances as the Module Class Suffix I have placed in each of my 2 instances is not being appended in the code so I can apply individual styles.

Try to go into Extensions Manager->Plugins->Content- Load Module plugin and play around with the settings there: Style

Success!

Many thanks.

Went in and changed the style from "Wrapped by Table(column)" to "Wrapped by divs" and now I can successfully apply individual styling.
