
MiniFP does not display any articles

Posted by Bvok - 2010/03/02 06:00

Hi

I have searched this forum for answers and have been working on this for several hours, fiddling with settings but whatever I do I cannot get MiniFP to display any content. I just get the title and then nothing. I am using the CelebsPlazza template.

I have tried re-downloading and re-installing the module (as part of the celebs plazza package and also standalone) but still nothing.

Can anyone offer any ideas as to why this is happening?

Many thanks

=====

Does MiniFP rely on any other modules being published? I did have 'sections' unpublished - I have now republished this but still nothing :(

I've also been reading through all recent threads on this forum, trying ideas and other solutions, still nothing shows up.

If anyone has got any ideas I am all ears. I am getting to the end of my tether with this! :)

Do you have celebs plazza quickstart installed on your local test system? If you do you can copy the setting of minifrontpage module parameters from there. MiniFP don't rely on any module but your contents.

Thanks for the quick reply.

I do not have quickstart installed but I will set it up now on another domain and copy the parameters over. I will update this thread with the results.

Ok, I set up a quickstart installation on the same server as my 'live' installation. The MiniFP is working ok on this test installation. I then copied the entire params fields from test to my live install but still nothing.

Any other ideas? I have tried using existing articles and creating new ones but still no articles are displayed.

Make sure you input the correct section/category ID on the MiniFP module parameter. That's depends on where your articles/contents are belongs to these section(s) or category(s).

Thanks Erwin. Yes, I have done that and I have tried almost all setting combinations but still nothing.

Mind if I take a look at your backend admin? send me the account through my PM.

Any news? PM with access info to our installation was sent over 2 days ago and I've not heard anything yet.

I have setup with the right category ID on the module. Take a look that sample. You've filled it with the wrong category id before.

I think you have got me mixed up with someone else? My admin system says that your admin user has never logged in and the module still is not working.

Re:MiniFP does not display any articles

Actually, don't worry about it - I will use a different module. Thanks for your help.

actually, if you used the right category ID and section ID on the module, it should be working properly.
so i'm not sure if its the trouble from this module

Good Luck

I tried many different categories and section ID's. I even set up a new test category, section and articles. The problem is not with section/category ID's.
